REASONS FOR ALLOWANCE

The Gosselin reference, (US 6,444,652) teaches preparation of the nucleoside from the protected ribose and OTMS protected uracil using dichloroethane as solvent. There is no reference to the ratio of the beta and alpha anomers. This patent references another NPL document (J. Heterocyclic Chem., 1993, 30, 1229-33) for the scheme shown in the '652 patent at col. 24-25. See page 1231, preparation of compound 7 in the NPL reference. The difference between this scheme and the instant process (claim 13) is that the ribose sugar has a chlorine at the anomeric position whereas the '652 patent has OAc (acetate). But a similar process is taught by the Weiss reference (WO 96/13512). At page 20, Weiss teaches the reaction of compound 56 (haloribose) with a purine in acetonitrile as solvent to give compound 57 (also see Example 25 at page 35 for description). Both Gosselin and Weiss do not suggest other solvents that could be used in the said reactions either. Based on these two prior art teachings, the instant process drawn to the preparation of β -L-2'-deoxythymidine and β -L-2'-deoxyuridine, which is conducted in chloroform to produce a 10:1 ratio of beta: alpha anomer as evidenced by the instant Declaration is neither taught or fairly suggest by the prior art of record. Thus, the unique solvent, chloroform, employed in the particular process, is seen to provide unexpected results regarding the 10:1 ratio of beta: alpha anomer. Therefore, the claimed process is seen not to be anticipated or obvious over the prior art.

Accordingly, the application is deemed in condition for allowance.

Any comments considered necessary by the applicant must be submitted no later than the payment of the issue fee and, to avoid processing delays, should preferably accompany the issue
